**Key words:** *Agrostis stolonifera* L. cv. Yuexuan No.1 golf green, turf quality, growth speed, evapotranspiration rate

**Introduction** In order to enhance the stability of high temperature and high humidity stress and construct evergreen green in Guangzhou area, we researched traits of *Agrostis stolonifera* L. cv. Yuexuan No.1 and Penncross. the character of *Agrostis stolonifera* L. cv. Yuexuan No.1 derived from Penncross was better than that of Penncross(Chen *et al.*, 2005).

**Materials and methods** Green turf was constructed with *Agrostis stolonifera* Yuexuan No.1 and Penncross, and pruned to 6mm in 2006. The density, coverage, texture, growth rate, leaf color, leaf senescence index and evapotranspiration rate were measured in summer using the method as described (Chen *et al.*, 2007).

**Results** Green coverage, density, chlorophyll of Yuexuan No.1 were higher than those of Penncross ( $p < 0.05$ ), and texture was much better than that of Penncross ( $p < 0.05$ ) (Figure 2). The growth rate of Yuexuan No.1 was much lower than that of Penncross from January to March. The growth rate of Yuexuan No.1 was much higher than that of Penncross from June to August ( $p < 0.05$ ) (Figure 1). The leaf senescence index of Yuexuan No.1 was also higher than that of Penncross ( $p < 0.05$ ). According to Beard's (Beard, 1985) evapotranspiration classification, the evapotranspiration rate of green turf was medium-low. The evapotranspiration rate of Yuexuan No.1 was much lower than that of Penncross ( $p < 0.05$ ) (Figure 2).

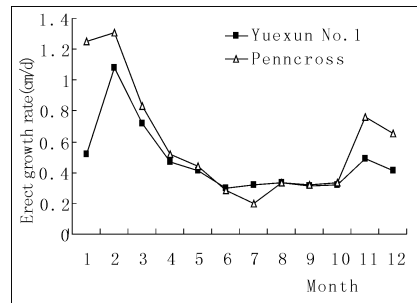

Figure 1 Erect growth rate in golf-green.

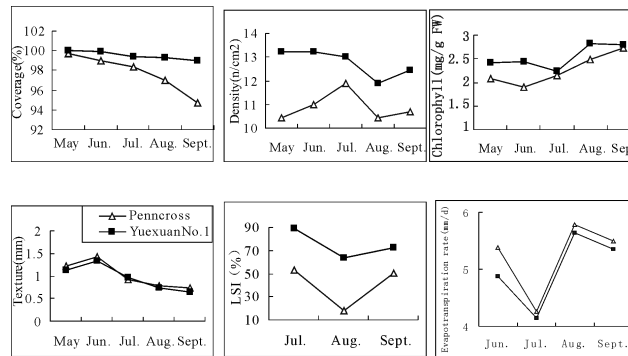

Figure 2 Green coverage, density, texture, leaf color, evapotranspiration rate of Yuexuan No.1 and Penncross.

**Conclusions** Compared with Penncross, the assessment on turf quality of Yuexuan No.1 was high and had good color, the evapotranspiration rate was low.
